

## Assignment - 1

Name: Sciddhanto Sinha

Class: CSE, SY-2(B)

Roll No.:2213111

Enrollment No.: MITU21BTCS0553

**Aim :** Use print in Python to produce the following outputs:

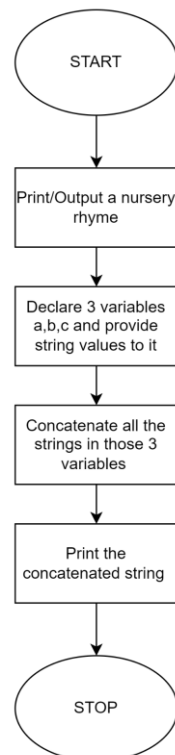

- Programming\*\*\*Essentials\*\*\*in...Python
- Nursery rhyme of your choice (with proper indentation and newline)
- Assign three string values say “A”, “B”, “C” to the variables and print them as below: HI, A B C

**Theory :** In this assignment we have to use the print function in python (**print**)

Which will as the name suggests show the required results using the output stream to the output devices like display etc

To use the **print** function use of appropriate syntax is necessary which is to use parentheses ( sample code within parentheses ) and within those parentheses using single ‘ ’, double “ ”, or triple “ “ “ ” ” ” (for multi-line printing ) quotations is used.

For concatenation of strings we use the plus (+) operator it is similar to addition of integers but with the caveat of instead of literal addition of string the strings are clubbed/joined together to create a new string from multiple smaller strings

## Program :

```
print("\n :: Nursery Rhyme :: \n")
print("""Baa, baa, black sheep,
Have you any wool?
Yes sir, yes sir,
Three bags full.
One for the master,
One for the dame,
And one for the little boy
Who lives down the lane \n\n""")

a = "A"
b = "B"
c = "C"
hello = "Hi, " + a + b + c
print("Concatenation of the strings is :: ", hello)
```

## Output :

```
:: Nursery Rhyme ::

Baa, baa, black sheep,
Have you any wool?
Yes sir, yes sir,
Three bags full.
One for the master,
One for the dame,
And one for the little boy
Who lives down the lane

Concatenation of the strings is ::  Hi, ABC
```

**Conclusion :** In this assignment we learnt and implemented how to use the **print** function and also how to declare variables and strings to then concatenate them using the + operator
