

Assignment - 2

Name: Sciddhanto Sinha

Class: CSE, SY-2(B)

Roll No.:2213111

Enrollment No.: MITU21BTCS0553

Aim : (Operators) Your task is to read the input numbers from the user [on the same line] and implement basic calculations -

Addition, subtraction, division, floor division, multiplication,
Exponentiation, Modulus

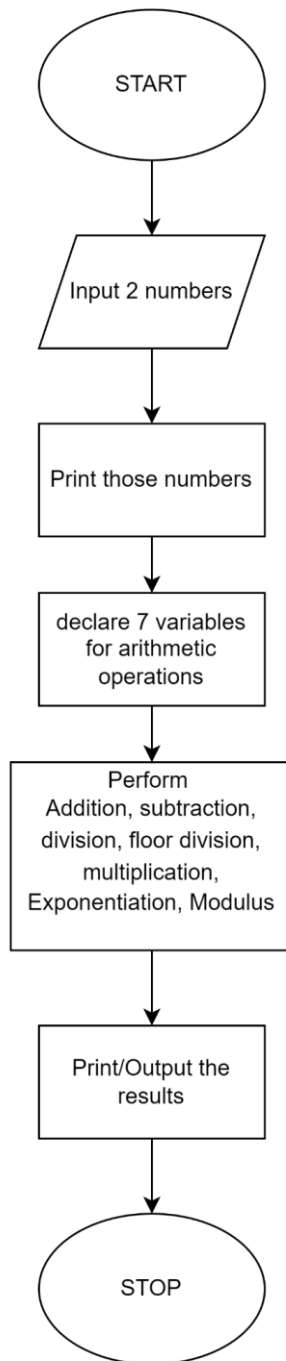

Theory : As we have already learnt how to use **print** function we can now print our desired results but what about when we want to take input from the user, for that we would need to use the **input** function which would take the input in integer or string or other format and store it for future reference, we can specify what data type do we need the user to enter for the program using the **int** or **str** data type

The syntax for it would be

int(input("Enter number :: "))

To perform operations on the numbers that we asked the user now we need to store them in user defined variables (ex- num1 and num2)

Now using the arithmetic operators for addition (+) , subtraction (-) , multiplication (*) , division (/) , exponential (**) , floor division/ rounds the result of division to nearest integer (//) , modulus/remainder (%)

Program :

```
num1=int(input("Enter 1st Number :: "))
num2=int(input("Enter 2nd Number :: "))
print("The 1st and 2nd Number you entered are :: ",num1, num2)
```

```
sum = num1 + num2
sub = num1 - num2
div = num1 / num2
fl_div = num1 // num2
multi = num1 * num2
expo = num1 ** num2
mod = num1 % num2

print("Summation of Num1 and Num2 is :: ", sum)
print("Subtraction of Num1 and Num2 is :: ", sub)
print("Division of Num1 and Num2 is :: ", div)
print("Floor Division of Num1 and Num2 is :: ", fl_div)
print("Multiplication of Num1 and Num2 is :: ", multi)
print("Exponent of Num1 to power Num2 is :: ", expo)
print("Remainder of division of Num1 and Num2 is :: ", mod)
```

Output :

```
Enter 1st Number :: 8
Enter 2nd Number :: 3
The 1st and 2nd Number you entered are ::  8 3
Summation of Num1 and Num2 is ::  11
Subtraction of Num1 and Num2 is ::  5
Division of Num1 and Num2 is ::  2.6666666666666665
Floor Division of Num1 and Num2 is ::  2
Multiplication of Num1 and Num2 is ::  24
Exponent of Num1 to power Num2 is ::  512
Remainder of division of Num1 and Num2 is ::  2
```

Conclusion : In this assignment we learnt about how to declare variables, taking input from user and storing in variables and performing multiple arithmetic operators in python
