

Assignment - 3

Name: Sciddhanto Sinha

Class: CSE, SY-2(B)

Roll No.:2213111

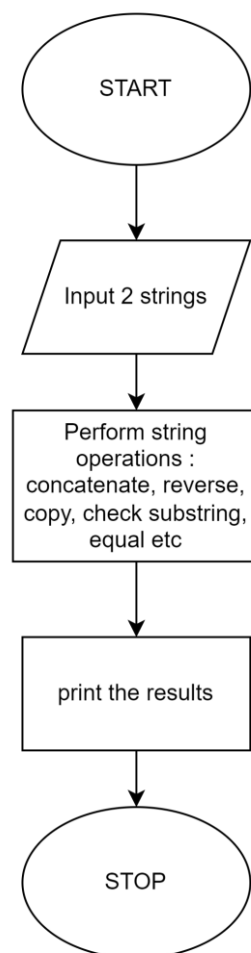

Enrollment No.: MITU21BTCS0553

Aim : Write python program for string operations- copy, concatenate, check substring, equal, reverse and length.

Theory : In this assignment we will understand how to input strings from the user which is exactly similar to the previous assignment with the only change in the syntax being instead of **int** we will use **str** data type

Also to perform the string operations like finding length we will use the **len** function and **+** operator for the concatenation

For checking substring or equality we would need to create a **if-else** loop and with the conditions being **in** or **is** respectively

Program :

```
str1 = str(input("Enter 1st string :: "))
str2 = str(input("Enter 2nd string :: "))

print("The 1st String you entered is :: ",str1)
print("The 2nd String you entered is :: ",str2)

str3=str1                                     #copy string
b = str1 [ 0 :    : 2 ]                       #string slicing
reverse_str = str1 [-1 :    : -1]             #reverse
addstrs = str1 + " " + str2                   #concatenation of
string
len_of_str = len(str1)                       #length of string

if str1 is str2 or str1 == str2:
    print("String 2 is equal to string 1")     #equality
else:
    print("String 2 is not equal to Str 1 ")

if(str2 in str1):
    print("String 2 is a substring of 1st string")    #check substring
else:
    print("String 2 is not a substring of 1st string")

print("The concatenation of string 1 and string 2 is :: ",addstrs)
#concatenation of string
print("The length of String 1 is :: ",len_of_str)
#length of string
print("The reverse of 1st is :: ",reverse_str)
#reverse
print("The sliced version of 1st String from 0th index with step of 2 ::
",b)
#string slicing
print("The Copy of 1st String is  :: ",str3)
#copy string
```

Output :

```
Enter 1st string :: Rudradev
Enter 2nd string :: dev
The 1st String you entered is :: Rudradev
The 2nd String you entered is :: dev
String 2 is not equal to Str 1
String 2 is a substring of 1st string
The concatenation of string 1 and string 2 is :: Rudradev dev
The length of String 1 is :: 8
The reverse of 1st is :: vedarduR
The sliced version of 1st String from 0th index with step of 2 :: Rdae
The Copy of 1st String is :: Rudradev
```

Conclusion : In this assignment we learnt to input strings for the user and perform multiple operations like concatenation, reversing, slicing, copying, length, check equal and check substring etc
